

# Roundup Found in Breast Milk

In the first ever testing for glyphosate herbicide in the breast milk of American women, Moms Across America and Sustainable Pulse have found 'high' levels in 3 out of the 10 samples tested.

Glyphosate is the active ingredient in Monsanto's "Roundup." Monsanto's sales of Roundup jumped 73 percent to \$371 million in 2013 because of its increasing use on genetically modified (GM) crops.

The levels found in the breast milk testing are 760 to 1,600 times higher than the European Drinking Water Directive allows for individual pesticides.

The shocking results point to glyphosate levels building up in women's bodies over a period of time, which has until now been refuted by both global regulatory authorities and the biotech industry.

Since the introduction of Monsanto's Roundup ready crops in 1996, GM technology has driven up the use of Roundup in the US by more than 527 million pounds.

Recent studies are finding alarming levels of glyphosate in our drinking water. And now we're also finding it in mother's milk.

Yours for a food revolution,
